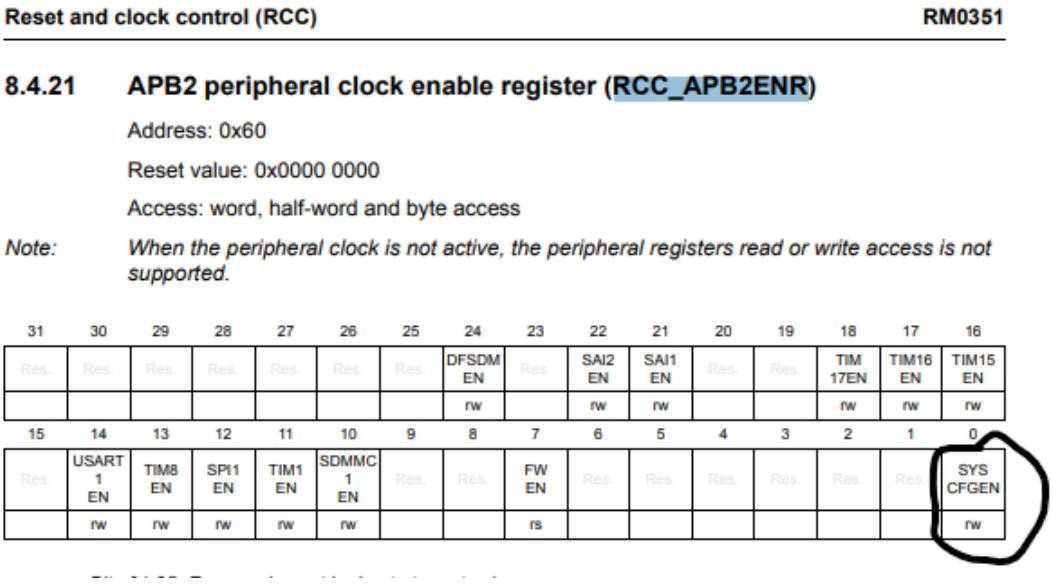
Dylan Thornburg | ELEN 120L prelab 5

QUESTIONS 1 AND 3 DO NOT ASK FOR ANY DELIVERABLES

Plan for each question in lab:

1. We need to use the joystick center (PA0) instead of joystick up (PA3). By changing the interrupt to EXTI0 instead of EXTI3, we do accomplish this. Because we are toggling the LED, we will have to change the state of the green LED's bit without setting it to high or low and instead just switching it's state. We can do this by "not-ing" the bit.
2. For problem two we will start out using the same process as problem one, but switch the code so that it only responds to pin 5.To stop it from responding to pins 6-9, we can disable those pins or write in some code that makes sure we only take input from pin 5.
3. Problem three will just be us analyzing timer and changing the code to make it operate at 1khz. We will use the 3999 number and 1khz to properly calculate the prescalar and check our math on the oscilloscope.

Screenshots of bits being cleared or set:



Reset and clock control (RCC) **RM0351**

8.4.21 APB2 peripheral clock enable register (RCC_APB2ENR)

Address: 0x60

Reset value: 0x0000 0000

Access: word, half-word and byte access

Note: When the peripheral clock is not active, the peripheral registers read or write access is not supported.
